INSTRUCTIONS

Vue générale du test de compression.

En cas de baisse de performances d'un moteur ou en cas de ratés ne pouvant être attribués au démarrage ou aux systèmes de carburant, un test de compression peut permettre d'obtenir des indices pour établir un diagnostic sur l'état du moteur.

La compression doit augmenter rapidement dans un moteur en bon état de fonctionnement. Tout relevé de compression trop basse à la première accélération suivi d'une augmentation progressive de la pression lors des accélérations suivantes signifie que les garnitures de piston sont usées.

Un relevé de compression trop basse à la première accélération qui n'augmente pas au cours des accélérations suivantes signifie que les soupapes fuient ou que le joint de culasse est défectueux (il peut également s'agir d'une fissure dans la tête du joint de culasse).

La présence de résidus en dessous des têtes de soupape peut également entraîner une compression basse. Si la pression d'un cylindre est considérablement plus basse que dans les autres, versez une petite quantité d'huile dans l'orifice d'accès du cylindre et recommencez le test.

Si l'ajout d'huile améliore temporairement la pression lors du test de compression, ceci signifie que la perte de pression est due à l'alésage du cylindre ou à l'usure du piston.

S'il n'y a aucune amélioration, ceci suggère que la fuite se trouve au niveau des soupapes ou que le joint de culasse est défectueux. Un relevé de mesure de compression basse sur deux cylindres voisins suggère que le joint de culasse est défectueux entre ces deux cylindres. La présence de liquide de refroidissement dans l'huile du moteur confirmera ce diagnostic.

Si la compression est trop élevée, les chambres de combustion sont probablement recouvertes de résidus de carbone. Dans ce cas, la tête du cylindre doit être démontée et nettoyée de tous résidus de carbone.

À titre indicatif, les moteurs ayant une pression de compression dépassant 100psi (6,9 bar) ne doivent pas subir une perte de compression supérieure à 10psi (0,69 bar). Sur les moteurs plus anciens avec une faible pression de compression, cette perte ne doit pas dépasser 0.35 bar (5psi).

Test de compression

1. Vérifiez que le niveau d'huile du moteur est correct.
2. Retirez toutes les bougies de préchauffage/d'allumage du moteur.
3. Sélectionnez l'adaptateur adéquat dans le kit et vissez-le dans l'orifice de la bougie de préchauffage/d'allumage tout en vous assurant que le joint torique est bien hermétique (s'il est présent). Connectez le raccord du flexible du compressiomètre sur l'adaptateur et assurez-vous qu'il soit bien enclenché.
4. Donner un coup de démarreur et observez le cadran de l'appareil pour voir s'il y a une augmentation régulière de la mesure. Notez sur un papier le maximum atteint. Reportez-vous au manuel d'atelier du constructeur du moteur/véhicule pour obtenir plus de renseignements sur les taux normaux à respecter.
5. Appuyez sur la vanne de remise à zéro (sous le compressiomètre) pour libérer la pression. La vanne de remise à zéro permet de répéter le test si nécessaire sans avoir à déconnecter l'appareil de test de l'orifice de la bougie de préchauffage/d'allumage.

AVERTISSEMENT ! Veuillez toujours utiliser la vanne de remise à zéro pour libérer la pression AVANT de débrancher l'appareil de test.

6. Déconnectez le compressiomètre de l'adaptateur et retirez l'adaptateur de l'orifice de la bougie de préchauffage/d'allumage. Installez les dans l'orifice de la bougie de préchauffage/d'allumage du cylindre suivant et répétez le test. Poursuivez le test sur tous les autres cylindres.

REMARQUE : toute variation des relevés de mesure de la compression entre les cylindres est un signe de problème du moteur et non pas une valeur de compression individuelle normale.

| CONDITION DE COMPRESSION | ACTION/DIAGNOSTIC |
|--|---|
| Relevé de mesure de basse compression sur certains cylindres. | (a) Verser de l'huile dans le cylindre pour vérifier l'usure des garnitures. (b) Si la compression augmente, les garnitures et/ou la paroi du cylindre sont usées. (c) Si la compression n'augmente pas, procédez à un test d'étanchéité du cylindre pour déterminer la source du problème. |
| Relevés de mesure de compression relative élevée et relevés de mesure sensiblement similaire pour chaque cylindre. | En cas d'émissions d'échappement excessive, de manque de puissance, de faibles performances ou d'une trop grande consommation de carburant, procédez à un test d'étanchéité du cylindre pour déterminer la source du problème. |
| Relevés de mesure de compression relative plus faible. Un ou plusieurs cylindres ont des relevés de mesure plus faible que les autres. | Procédez à un test d'étanchéité du cylindre pour déterminer la source du problème. |

Indicateur de PMH

1. Retirez la bougie de préchauffage/d'allumage du cylindre n°1. Il sera peut-être également nécessaire de retirer toutes les bougies de préchauffage/d'allumage pour pouvoir actionner le démarreur plus facilement.
2. Sélectionnez l'adaptateur adéquat dans le kit et vissez-le dans l'orifice de la bougie de préchauffage/d'allumage du cylindre n°1. Assurez-vous que le joint torique est bien hermétique (s'il est présent). Connectez le raccord du flexible de l'indicateur PMH sur l'adaptateur et assurez-vous qu'il soit bien enclenché.
3. Placez l'indicateur en position verticale, à un endroit facile d'accès, à l'aide d'un crochet magnétique si nécessaire.
4. Démarrez le moteur manuellement en actionnant le démarreur à l'aide d'une clé ou d'une prise sur la poulie du vilebrequin et dans le sens de rotation du moteur. Observez le flotteur monter dans le tube. Tandis que le piston s'élève au cours de la course de compression, le flotteur s'élève et reste au-dessus du tube. Lorsque le piston passe le PMH et que la compression est perdue, le flotteur redescend brusquement. Notez la position et identifiez temporairement le PMH ou comparez avec la marque de calage existante.

5. Faites tourner le moteur d'un 3/4 de tour supplémentaire et le flotteur devrait s'élever de nouveau tandis que le piston monte sur la course de compression. Continuez à tourner lentement le vilebrequin jusqu'au PMH (en vérifiant bien la marque de calage) et notez le point exact de coulée du flotteur. Modifier la marque de calage si nécessaire.
6. Répétez la procédure, en faisant tourner le moteur de 2 tours supplémentaires pour vérifier la précision.
7. Déconnectez l'indicateur de PMH de l'adaptateur et retirez l'adaptateur de l'orifice de la bougie de préchauffage/d'allumage.

Test d'étanchéité : connexion à une conduite d'air

1. Le branchement conseillé est indiqué à la Fig. 1. Une pression d'air de 45 à 100psi est requise.
 2. Assurez-vous que la vanne de régulation d'air est fermée (position "off" avant le branchement à l'alimentation en air.
- AVERTISSEMENT ! Assurez-vous que l'alimentation en air est propre et ne dépasse pas la limite de pression indiquée. Une pression d'air excessive et une alimentation en air impur réduisent la durée de vie de l'appareil de test en raison d'une usure excessive. Elles sont également dangereuses et peuvent entraîner l'endommagement des équipements et/ou des blessures corporelles.
3. Purgez le réservoir du compresseur d'air tous les jours. Toute présence d'eau dans la conduite d'air endommagera l'appareil de test.
 4. Nettoyez le filtre d'admission d'air toutes les semaines.
 5. La pression dans la conduite d'air doit être augmentée pour compenser l'utilisation de tuyaux d'air de longueur inhabituelle (plus de 8 mètres). Le diamètre minimum du tuyau et des raccords doit être de 1/4".
 6. Tenez les tuyaux à l'écart de la chaleur, de l'huile et des objets tranchants. Vérifiez toutes les traces d'usure sur les tuyaux et assurez-vous que tous les raccordements sont bien fixés.

INSTRUCTIONS

Overview of Compression Testing

When an engine's performance is down, or if misfiring occurs which cannot be attributed to the ignition or fuel systems, a compression test can provide diagnostic clues as to the engine's condition.

Compression should build up quickly in a healthy engine. A very low compression reading on the first stroke, followed by gradually increasing pressure on successive strokes, indicates worn piston rings. A low compression reading on the first stroke, which does not build up during successive strokes, indicates leaking valves or a faulty head gasket (a cracked head could also be the cause).

Deposits on the undersides of the valve heads can also cause low compression.

If the pressure in any cylinder is considerably lower than the others, introduce a small quantity of clean oil into that cylinder through the access hole, and repeat the test.

If the addition of oil temporarily improves the compression pressure, this indicates that bore or piston wear is responsible for the pressure loss.

If there is no improvement, it suggests that the leakage is around the valves, or a faulty head gasket. A low reading from two adjacent cylinders

suggests a faulty head gasket between the two cylinders. The presence of coolant in the engine oil will confirm this.

If the compression is unusually high, the combustion chambers are probably coated with carbon deposits.

If this is the case, the cylinder head should be removed and de-carbonised.

As a rough guide, engines having a compression pressure in excess of 100psi (6.9 bar), should not exceed a compression loss of more than 10psi (0.69 bar). On older engines with lower compression pressure, loss should not exceed 0.35 bar (5psi).

Compression Testing

1. Check the engine oil is at the correct level.
2. Remove all of the glow plugs/spark plugs from the engine.
3. Select the applicable adaptor from the kit and screw it into the first glow/spark plug port, ensuring there is a good seal with the O-ring (if fitted). Connect the coupling on the pressure gauge hose to the adaptor, ensuring it locks into place.
4. Turn over the engine using the starter motor and observe the gauge, looking for a steady increase in the reading and note the maximum reading obtained. Refer to the vehicle/engine manufacturer's workshop manual for compression data.
5. Depress the Re-set Valve (situated under the gauge) to release the pressure. The Re-set Valve allows the test to be repeated if required without disconnecting the tester from the glow/spark plug port.
WARNING! Always release pressure via the Re-set Valve BEFORE disconnecting the Tester.
6. Disconnect the compression tester from the adaptor and remove the adaptor from the glow/spark plug port. Install them into the next cylinder's glow/spark plug port and repeat the tests. Continue the tests for all of the remaining cylinders in turn.

NOTE: A variation in compression readings between cylinders is often a better indication of engine problems than the individual values of compression

| CONDITION DE COMPRESSION | ACTION/DIAGNOSTIC |
|---|---|
| Low compression reading on some cylinders. | (a) Use oil in cylinder to see if rings are worn. (b) If compression increases, rings and/or cylinder wall are worn. (c) If compression does not rise, do a cylinder leakage test to determine source of problem. |
| High relative compression readings and relatively equal cylinder readings. | If excessive exhaust emissions, lack of power, poor performance, or poor fuel consumption do a cylinder leakage test to determine source of problem. |
| Lower relative compression readings. One or more cylinders lower than others. | Do a cylinder leakage test to determine source of problem. |

TDC Indicator Tool

1. Remove the glow/spark plug from cylinder number 1. It may also be necessary to remove all glow/spark plugs to facilitate manual turning over of the engine.
2. Select the applicable adaptor from the kit and screw it into the glow/spark plug port of cylinder number 1. Ensure that there is a good seal with the O-ring (if fitted). Connect the coupling on the TDC finder to the adaptor, ensuring it locks into place.
3. Position the indicator in a vertical position, in a suitable viewable location, using the magnetic hook if needed.
4. Turn the engine over manually, using a spanner or socket on the crankshaft pulley, in the direction of engine rotation and watch for the float to rise in the tube. As the piston rises on the compression stroke, the float will rise to the top of the tube and stay there, when the piston goes past TDC and compression is lost, the float will suddenly sink. Note the position and temporarily make suitable marks to indicate TDC, or compare with existing timing marks.
5. Turn the engine over a further $1\frac{3}{4}$ turns and the float should start to rise again as the piston rises on the compression stroke. Continue to slowly turn the crankshaft towards TDC (watching the timing marks) - note the exact point when the float drops.

Alter the timing mark if required.

6. Repeat the procedure, turning the engine over a further 2 turns to re-check for accuracy.
7. Disconnect the TDC tool from the adaptor and remove the adaptor from the glow/spark plug port.

Leakage Testing - Connecting to an Air Line

1. The recommended hook-up is shown in Fig.1. An air pressure of 45 to 100psi is required.
2. Ensure that the air valve regulator is in the "off" position before connecting to the air supply.

WARNING! Ensure that the air supply is clean and does not exceed the pressure quoted. Too high an air pressure and/or unclean air will shorten the life of the tester due to excessive wear and may be dangerous, causing damage and/or personal injury.

3. Drain the compressor air tank daily. Water in the air line will damage the tester.
4. Clean compressor air inlet filter weekly.
5. Line pressure should be increased to compensate for unusually long air hoses (over 8 metres). The minimum bore for hose and fittings is 1/4".
6. Keep hoses away from heat, oil and sharp edges. Check hoses for wear and make certain that all connections are secure.
